SUMMARY

AI Developer with experience in building LLM-powered applications using FastAPI, RAG pipelines, AI agents, and prompt engineering. Skilled in developing scalable Generative AI solutions using LangChain, OpenAI/Gemini APIs, vector databases, and backend AI services.

PROFESSIONAL EXPERIENCE

AI Developer, Viljetech Labs - Developed LLM-powered Generative AI applications for enterprise automation and document intelligence workflows. - Built AI-powered TARIC classification and Purchase Order processing systems using prompt engineering and structured LLM outputs. - Developed RAG pipelines using semantic search and vector databases, improving contextual response accuracy by ~35%. - Developed FastAPI backend services and REST APIs for integrating OpenAI/Gemini-powered AI features into production applications. - Designed AI agent workflows with prompt orchestration, tool usage, and automated task execution. - Engineered PDF-to-structured JSON extraction pipelines, reducing manual document processing effort by ~50%.	Oct 2025 – May 2026 Hyderabad
--	----------------------------------

SKILLS

Programming Python, SQL	AI/ML Scikit-learn, Numpy, Pandas, Linear Regression, Logistic Regression, Decision Trees, Random Forest, XGBoost, SVM, NLP, TensorFlow, CNN, RNN, LSTM, Transformers
LLM & GenAI LangChain, LangGraph, RAG, Prompt Engineering, AI Agents, OpenAI/ Gemini APIs, Ollama models, Hugging Face	Backend FastAPI, Rest APIs, Pydantic
Databases PostgreSQL, Pinecone, Weaviate, FAISS	Tools Git, GitHub, Docker, Cursor, Codex

PROJECTS

Natural Language to SQL - Developed an NLP-to-SQL system using LLM prompting and schema-aware context injection for converting natural language into executable SQL queries. - Built FastAPI-based REST APIs for real-time query generation and structured result retrieval from relational databases. - Implemented prompt engineering, query validation, and dynamic schema parsing, improving SQL query accuracy by ~30%. - Enabled non-technical users to retrieve business insights through natural language queries, reducing manual SQL effort by ~40%.
AI Documentation & Architecture Generation System  - Developed an AI-powered documentation automation system using FastAPI, ReactJS, PostgreSQL, and OpenAI APIs for generating project README files, architecture insights, and effort estimations. - Integrated Gmail API and Google OAuth 2.0 to process 100+ Google Meet notes and uploaded project documents through automated document intelligence workflows. - Built LLM-based summarization and structured JSON extraction pipelines to generate project summaries, tech stacks, blockers, and action items, reducing manual documentation effort by ~35%. - Developed AI-driven architecture generation and project effort estimation workflows based on project scope, team size, and developer seniority levels.
AI-Powered TARIC Classification System - Developed an AI-powered TARIC classification system using OpenAI APIs and FastAPI for predicting hierarchical 10-digit TARIC codes from product descriptions and dining set product data. - Implemented beam search-based hierarchical code prediction workflows to classify products across chapters, sub-chapters, and category levels with improved classification accuracy. - Built automated file-processing pipelines to extract article numbers and product descriptions from uploaded files for real-time TARIC code prediction. - Designed structured classification logic for sequential code traversal, enabling accurate multi-level product categorization and reducing manual classification effort by ~45%.

EDUCATION

B.Sc. Data Science, Mahatma Gandhi University	Sep 2022 – Jul 2025
--	---------------------
